

**Onsite Summary - Diamond Drilling**

General Working Condition

Use marsh funnel to examine the mud, mud viscosity of drilling mud in the mud pit (mud came out from bore hole) is 34~36S. After centrifuge's treatment, the viscosity turns to 31~32S.

The mud coming out of the decanter centrifuge looks very clean.

For 2 days less than 12 hours / day, totally one square meter of drilled solids were removed.

Submersible Slurry Pump transfers the mud from mud pit to the mud cleaning system.
